

# N100 Analyst Guide

Generated: 2026-08-19 19:56:06

## Purpose

The N100 Financial Intelligence Platform provides a structured workflow for financial data ingestion, validation, ratio analysis, screening, peer comparison, valuation, cash-flow intelligence and dashboard consumption.

## Primary Workflow

| Item         | Description                                                       |
|--------------|-------------------------------------------------------------------|
| 1. Data      | Load and validate source financial datasets.                      |
| 2. Database  | Store normalized financial data in SQLite.                        |
| 3. Ratios    | Calculate profitability, leverage, liquidity and efficiency KPIs. |
| 4. Screener  | Apply configurable financial screening rules.                     |
| 5. Peers     | Compare companies using normalized financial metrics.             |
| 6. Valuation | Review valuation-oriented dashboard datasets and summaries.       |
| 7. Cash Flow | Review cash-flow quality and intelligence outputs.                |
| 8. Dashboard | Consume results through the Streamlit dashboard.                  |
| 9. Reports   | Use generated workbook, HTML and PDF deliverables.                |

## Canonical Output Locations

| Item     | Description                                         |
|----------|-----------------------------------------------------|
| Output/  | Machine-readable analytical outputs.                |
| reports/ | Generated analytical and test reports.              |
| docs/    | User-facing documentation and acceptance artifacts. |
| DB/      | SQLite database.                                    |

## Quality Control

The final acceptance process checks required paths, database accessibility, expected tables, report artifacts and documentation. The final verification must report 23/23 passed before Sprint 6 is considered complete.
